accomplished by the media provider, third parties, or stored on the USTS 120.

#### Detailed Description Text - DETX (19):

By uniquely identifying each individual item of media content in the stream

database 145, users would request content and not individual media streams.

The USTS 120 could then analyze the request and determine which media stream is

the most appropriate for that particular user, based on geography, congestion,

preferential log-on, and any other factors deemed appropriate. The USTS 120

could then **redirect** the URL to the appropriate media stream.

Therefore, if the

same request for media content were executed at different times or different

**locations**, the user might be connected to different streams. By using this

**redirection**, the user could bookmark media content and not be concerned with

the details of which streams are available and always be **redirected** to the best

media stream, have the best available same to be played.

#### Detailed Description Text - DETX (30):

The stream characteristics records in stream database 145 may have fields

es that are not shown.

#### Detailed Description Text - DETX (3):

In the depicted example, distributed data processing system 100 may include the Internet with network 101 representing a worldwide collection of networks and gateways that use various protocols to communicate with one another, such as Lightweight Directory Access Protocol (LDAP), Transport Control Protocol/Internet Protocol (TCP/IP), Hypertext Transport Protocol (**HTTP**), **Wireless** Application Protocol (**WAP**), etc. Of course, distributed data processing system 100 may also include a number of different types of networks, such as, for example, an intranet, a **local** area network (LAN), or a wide area network (WAN). For example, server 102 directly supports client 109 and network 110, which incorporates **wireless** communication links. Network-enabled phone 111 connects to network 110 through **wireless** link 112, and PDA 113 connects to network 110 through **wireless** link 114. Phone 111 and PDA 113 can also directly transfer data between themselves across **wireless** link 115 using an appropriate technology, such as Bluetooth.TM. **wireless** technology, to create so-called personal area networks (PAN) or personal ad-hoc networks. In a similar manner, PDA 113 can transfer data to PDA 117 via **wireless** communication link 116.
